detect the presence of carbon, hydrogen and oxygen their presence is usually inferred from chemical reactions. The detection of hydrogen sulphur and halogens is carried out by converting them into water soluble ionic compounds. This has to be done very carefully because further analysis of the organic compound is largely based on the type of the element present in it. In order to detect hydrogen sulphur and halogen in organic compounds it is necessary to convert them into inorganic substance so that ionic tests of inorganic analysis may be applied. This may be accomplished by several methods but the best procedure is to fuse the organic compounds with metallic sodium (Lassaigne's test) or sodium cyanide.

Sodium sulphide and sodium halides which are readily identified if the above elements are present

$C, H, O, N, S, \text{Halogen} + Na \rightarrow NaCN + Na_2S + NH_3 + H_2O$
 It is essential to use an excess of sodium otherwise if sulphur and nitrogen are both present then sodium thiocyanate ($NaSCN$) may be produced with excess of sodium, the

Procedure \rightarrow Sodium fusion test Classification

- 2-3 drops of unknown substance are put in the fusion tube
- A piece of sodium is placed into the tube
- The hot tube is plunged into distilled water covered with a gauze
- Test for Nitrogen (cyanide test)
 To 1 ml of filtrate few drops of 0.5 M ferrous sulphate were added and a dark green precipitate of iron II hydroxide formed.
